

[Document ID: IT001]

Title: Windows Server Service Not Starting

Content:

If a Windows service fails to start, open Services.msc and check the service dependencies. Review Event Viewer for related error codes. Restart the dependent services and verify account permissions used by the service.

---

[Document ID: IT002]

Title: Active Directory User Account Locked

Content:

User accounts can become locked after multiple failed login attempts. To unlock an account, open Active Directory Users and Computers, right-click the user, and select "Unlock Account." Review the Security Logs to identify the source of failed logins.

---

[Document ID: IT003]

Title: DNS Resolution Failure

Content:

When users report website or domain name resolution issues, verify that the system is pointing to the correct DNS server. Use `ipconfig /flushdns` to clear the DNS cache, and run `nslookup` to test resolution. Restart the DNS Client service if necessary.

---

[Document ID: IT004]

Title: DHCP Scope Exhaustion

Content:

If clients fail to get IP addresses, check for scope exhaustion in the DHCP console. Extend the address range or create a new scope. Remove inactive leases and verify no conflicting DHCP servers are active on the network.

---

[Document ID: IT005]

Title: Slow Logon to Windows Server

Content:

Slow logons can be caused by Group Policy processing delays, network latency, or DNS misconfiguration. Check the Group Policy Results (gpresult /h report.html) and ensure the server is reachable to the domain controller.

---

[Document ID: IT006]

Title: Group Policy Not Applying

Content:

If Group Policy settings are not applying, run `gpupdate /force` and `gpresult /r` to confirm policy application. Ensure the computer is in the correct OU and that replication between domain controllers is healthy.

---

[Document ID: IT007]

Title: Server Backup Failed

Content:

Backup failures can occur due to insufficient storage, permission issues, or VSS (Volume Shadow Copy Service) errors. Check the Windows Event Viewer under Application logs and ensure the Backup service account has full access to the destination path.

---

[Document ID: IT008]

Title: Disk Space Low on C Drive

Content:

When disk space is low, run Disk Cleanup to remove temporary files. Move large log files to another drive, and consider expanding the virtual disk in VMware or Hyper-V. Avoid deleting system files manually.

---

[Document ID: IT009]

Title: VMware Virtual Machine Not Booting

Content:

If a VM fails to boot, check if the datastore is accessible and the virtual disk (VMDK) is intact. Review VMware logs for errors. If necessary, restore the VM from a recent backup or snapshot.

---

[Document ID: IT010]

Title: Remote Desktop Connection Fails

Content:

When RDP fails, ensure the Remote Desktop feature is enabled and the Windows Firewall allows TCP port 3389. Verify network connectivity using ping and confirm the user is part of the “Remote Desktop Users” group.

---

[Document ID: IT011]

Title: High CPU Usage on Server

Content:

High CPU usage may be due to background services or scheduled tasks. Open Task Manager or Resource Monitor to identify the process consuming resources. Investigate antivirus scans, indexing, or update processes.

---

[Document ID: IT012]

Title: Network Drive Not Accessible

Content:

If users cannot access network drives, verify that the shared folder path is correct and permissions are set appropriately. Check if the server hosting the share is online. Run `net use` to view mapped drives and re-map if disconnected.

---

[Document ID: IT013]

Title: Time Synchronization Issue

Content:

Domain-joined systems must synchronize time with the domain controller. Use `w32tm /query /status` to check synchronization. Restart the Windows Time service if desynchronized, and ensure firewall allows NTP traffic (UDP 123).

---

[Document ID: IT014]

Title: Windows Update Stuck

Content:

If updates are stuck downloading or installing, stop the Windows Update service and clear the SoftwareDistribution folder. Restart the service and reattempt updates. Check Windows Update logs for specific error codes.

---

[Document ID: IT015]

Title: Event Viewer Error 1058 - Group Policy

Content:

Error 1058 indicates a problem accessing Group Policy files. Check network connectivity to SYSVOL and NETLOGON shares on the domain controller. Ensure proper DNS resolution and SYSVOL replication.

---

[Document ID: IT016]

Title: File Server Access Denied

Content:

“Access Denied” messages on file servers may indicate NTFS permission conflicts. Verify both Share and NTFS permissions. Check if inherited permissions are blocked and adjust sec
